- The sequestering agents are substances which prevent adverse effect of metals catalysing the oxidative breakdown of foods forming chelates; thus inhibiting decolourisation, off-taste and rancidity.

71. Definition of buffering agents.

- Buffering agents are materials used to counter acidic and alkaline changes during storage or processing steps, thus improving the flavour and increasing the stability of foods.

- Unless otherwise provided in these rules the sequestering and buffering agents specified in column (1) of the Table below, may be used in the groups of food specified in the corresponding entry in column (2) of the said Table, in concentration not exceeding the proportions specified in the corresponding entry in column (3) of the said Table:-TABLE

It is composed of approximately 90 per cent resin acids and 10 per cent, neutrals (non-acidic compounds). The resin acid fraction is a complex mixture of isomeric diterpenoid monocarboxylic acids having the typical molecular formula of $C_{20}H_{30}O_2$ chiefly abietic acid. The substance is purified by steam stripping or by counter-current steam distillation.] [Inserted by G.S.R. 1211, dated 9-12-1958] Identification Solubility Insoluble in water, soluble in acetone and in Benzene. Infra Red Spectrum Obtain the infra-red spectrum of a thin film of the sample deposited on a potassium bromide plate-Scan between 600 and 4000 wave numbers. Compare with typical spectrum obtained from pure Estergum. Test for absence of Tall Pass the test as given below: Oil Rosin (Sulfur test) When sulphur containing organic compounds are heated in the presence of sodium formate, the sulphur is converted to hydrogen sulphide which can readily be detected by the use of lead acetate paper. A positive test indicates the use of tall oil rosin instead of wood rosin. Apparatus-Test Tube: Use a standard, 10x75mm, heat resistant, glass test tube-Burner, Bunsen: A small size burner of the microflame type is preferred. Reagents-Sodium Formate Solution : Dissolve 20g of reagent grade sodium formate, $NaOOCH$, in 100 ml of distilled water. Lead Acetate Test Paper- Commercially available from most chemical supply houses. Procedure - Weigh 40-50 mg of sample into a test tube add 1- 2 drops of sodium formate solution. Place a strip of lead acetate test paper over the mouth of the test tube. Heat the tube in the burner flame until fumes are formed that contact the test paper. Continue heating for 2-5 minutes. There must be no formation of a black spot of lead sulphide indicating the presence of sulphur containing compounds. Detection Limit: 50 mg/kg sulphur. Drop softening point Between $88^{\circ}C$ and $96^{\circ}C$ Arsenic Not more than 3 ppm. Lead Not more than 10 ppm Heavy metals (as lead) Not more than 40 ppm Acid value Between 3 and

2. Description and Types of Mineral Water.-(i) Natural mineral water is water clearly distinguished from ordinary drinking water because--

(a) it is characterised by its content of certain mineral salts and their relative proportions and the presence of trace elements or of other constituents; (b) it is obtained directly from natural or drilled sources from underground water-bearing strata and not from public water supply for which all possible precautions should be taken within the protected perimeters to avoid any pollution of, or external influence on, the chemical and physical qualities of natural mineral water; (c) of the constancy of its composition and the stability of its discharge and its temperature, due account being taken of the cycles of minor natural fluctuations; (d) it is collected under conditions which guarantee the original microbiological purity and chemical composition of essential components; (e) it is packaged close to the point of emergence of the source with particular hygienic precautions; (f) it is not subjected to any treatment other than those permitted by this standard. (ii) Naturally Carbonated Natural Mineral Water-A naturally carbonated natural mineral water is a natural mineral water which, after possible treatment as given hereunder and re-incorporation of gas from the same source and after packaging, taking into consideration usual technical tolerance, has the same content of carbon dioxide spontaneously and visibly given off under normal conditions of temperature and pressure. (iii) Non-Carbonated Natural Mineral Water-A non-carbonated natural mineral water is a natural mineral water which, by nature and after possible treatment as given

hereunder and after packaging taking into consideration usual technical tolerance, does not contain free carbon dioxide in excess of the amount necessary to keep the hydrogen carbonate salts present in the water dissolved.(iv)Decarbonated Natural Mineral Water-A decarbonated natural mineral is a natural mineral water which, after possible treatment as given hereunder and after packaging, has less carbon dioxide content than that at emergence and does not visibly and spontaneously given off carbon dioxide under normal conditions of temperature and pressure.(v)Natural Mineral Water Fortified with Carbon Dioxide from the Source-A natural mineral water fortified with carbon dioxide from the source is a natural mineral water which, after possible treatment as given hereunder and after packaging, has more carbon dioxide content than that at emergence.(vi)Carbonated Natural Mineral Water-A carbonated natural mineral water is a natural mineral water which, after possible treatment as given hereunder and after packaging, has been made effervescent by the addition of carbon dioxide from another origin.

3. Treatment and handling.-Treatment permitted include separation from unstable constituents, such as compounds containing iron, manganese, sulphur or arsenic, by decantation and/or filtration, if necessary, accelerated by previous aeration.

The treatments provided may only be carried out on condition that the mineral content of the water is not modified in its essential constituents, which give the water its properties.The transport of natural mineral waters in bulk containers for packaging or for any other process before packaging is prohibited. Natural mineral water shall be packaged in clean and sterile containers.The source or the point of emergence shall be protected against risks of pollution.The installation intended for the production of natural mineral waters shall be such as to exclude any possibility of contamination. For this purpose, and in particular :-(a)the installations for collection, the pipes and the reservoirs shall be made from materials suited to the water and in such a way as to prevent the introduction of foreign substances into the water;(b)the equipment and its use for production, especially installations for washing and packaging, shall meet hygienic requirements;(c)if, during production it is found that the water is polluted, the producer shall stop all operations until the cause of pollution is eliminated;

3A. [Packaging materials.-It shall be packed in clean, hygienic, colourless, transparent and tamperproof bottles/ containers made of polyethylene (PE) (conforming to IS: 10146 or polyvinyl chloride (PVC) conforming to IS: 10151 or polyalkylene terephthalate (PET and PBT) conforming to IS: 12252 or polypropylene conforming to IS : 10910 or foodgrade polycarbonate or sterile glass bottles suitable for preventing possible adulteration or contamination of the water.

All packaging materials of plastic origin shall pass the prescribed overall migration and colour migration limits.] [Inserted by G.S.R. 439(E), dated 19th June, 2002 (w.e.f. 1-9-2002).]
